

Introduction to Posit

1. Navigate to the website: posit.cloud

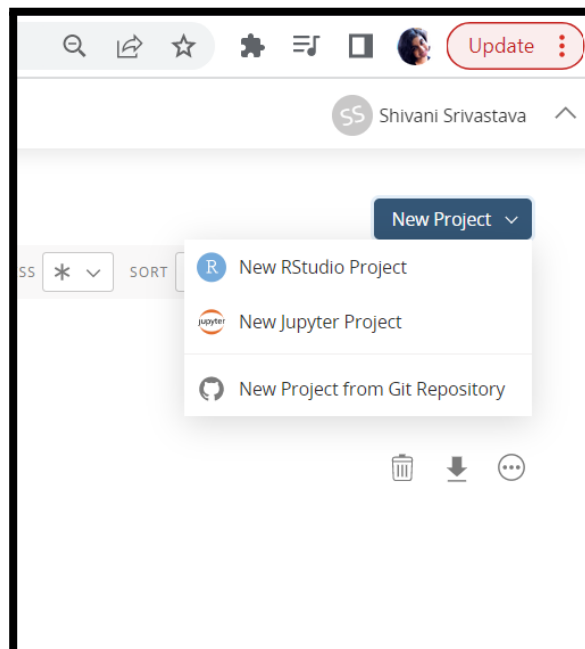

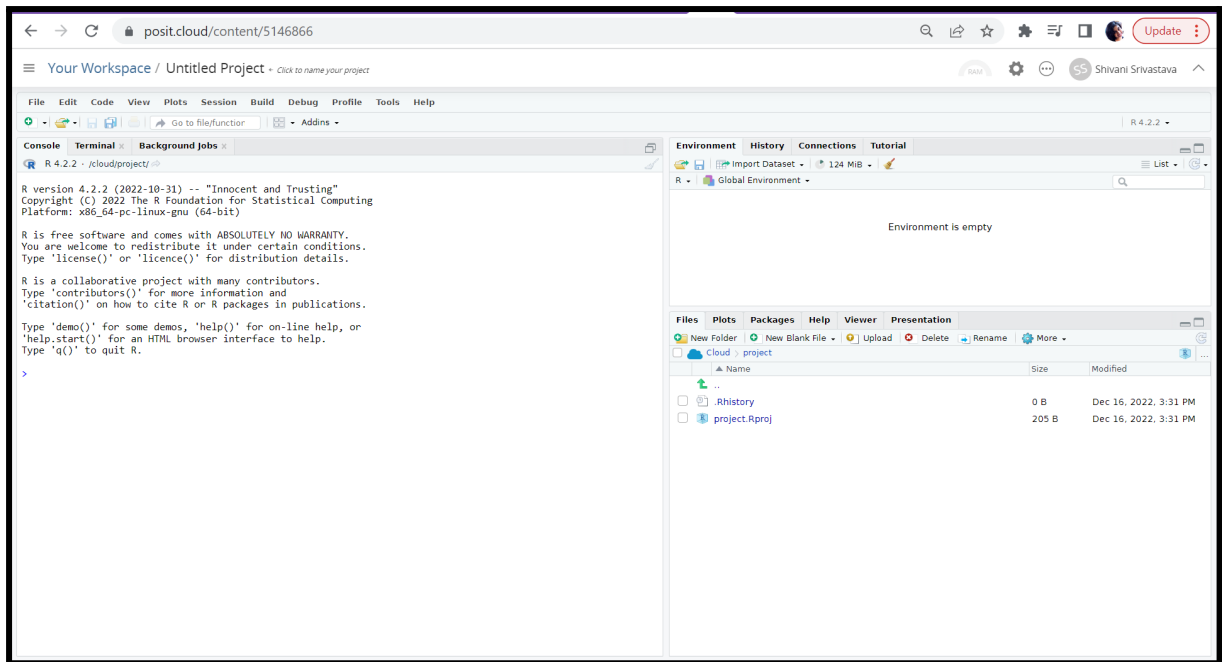

2. Navigate to the login page by clicking the *Already a User? Log In* - button and use **Google or Github** credentials to start the workspace.

3. Once the workspace is loaded, click the top right button to start a new project. Select **New RStudio Project**.

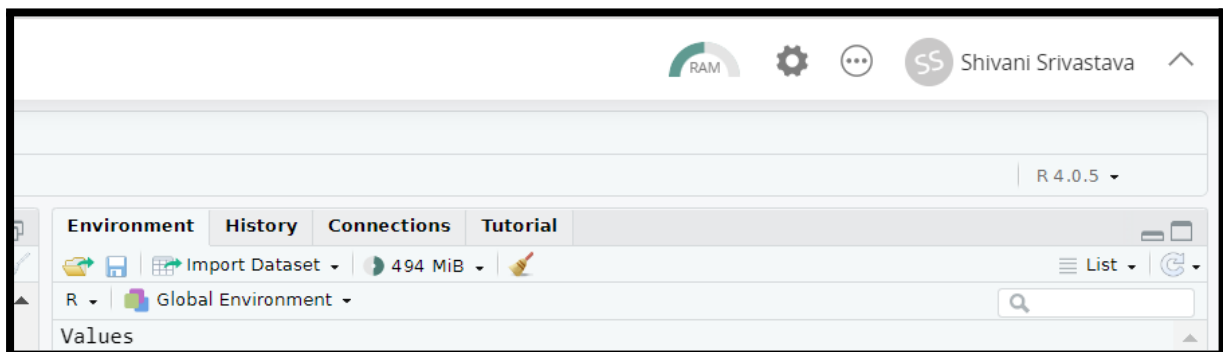

This is what the Workspace will look like. The left side of the screen is called the console, where the code will be written. The top right corner will contain the variables in the environment as they're defined. The bottom right contains the files and help window.

Any runcodes that will be entered will be pasted onto the console.

Please change the R version to **R 4.0.5** from the top right corner, for ease in implementing the applications in this session.

Error Handling

- After every application, please clear the workspace to allow the next application to be loaded. Use the three dots next to the username to relaunch the project in case of namespace errors or if the RAM dial turns red.
- Use the brush in the environment tab to clear all variables.
